

NTT Communications

Unified Threat Management

Be Prepared

In today's digital world, your business is susceptible to an array of security threats. Unsecured remote access is creating an open door for hackers to gain access to an organization's LAN, Intranet and other critical systems. SPAM overwhelms users' inboxes, requiring additional email client software to delete unwanted emails. Employees are constantly at risk of coming across a malicious website while browsing. And the list goes on. But these threats are often preventable, and there's no reason not to be protected.

At NTT Communications, we offer Unified Threat Management (UTM). It's our complete suite of security solutions that's proactive, not reactive, security. And that's the way it should be.

Our UTM services provide continuous monitoring and management with best-in-class security services on a single platform. It's all managed by one device. Designed to keep you secure.

READY FOR WHAT'S NEXT

Our UTM device is the next generation of real time network protection systems, designed to support multi-threat security environments. Deployed as an integrated or standalone solution, our UTM services detect and eliminate the threats of today and the emerging threats of tomorrow.

All inbound and outbound network traffic flows through this device as it identifies and destroys content-based threats (viruses, worms, intrusions, inappropriate web content) from email and web traffic without degrading network performance.

With our single, customized online portal, system management is easy. We give you intuitive reporting while helping you meet regulatory requirements. Our services are supported by certified Security Operations Engineers, available 24x7x365 and backed by four fully redundant data centers distributed across the nation.

Unified Threat Management

OUR UTM SERVICES

Managed Firewall: Our Managed Firewall service includes ongoing assessments of your Firewall and DNS setup, Firewall administration (including rule changes), maintenance of traffic flow, and Firewall reporting. With our service you can be confident that your first line of defense is truly protecting your network.

Intrusion Detection and Prevention: We monitor suspicious activity from devices placed on the inside of your network, and when suspicious activity is detected, we immediately take action to stop attacks and to keep intruders off your network. Our certified security professionals monitor your network, configure and maintain the UTM device, monitor logs, and analyze trends in intrusion attempts to ensure your network is secure.

Virtual Private Network: With NTT Communications' VPN service, you get routing, encryption, authentication, and data integrity to ensure connectivity is managed across your networks. Our service connects remote users, branch offices, suppliers and customers with the cost and performance advantages of public IP networks and the security and control of private networks.

Web Content Filtering: Our Web Content Filtering solution is the most advanced monitored content security product available on the market today. Our solution allows you to block and monitor all web traffic, including sites that reduce worker productivity, non-business related sites, and sites that require excessive bandwidth usage. We also utilize a Ratings Server Database containing millions of restricted websites that is continuously updated to block even the newest malicious sites.

Unified Threat Management

Anti-Virus: Protecting your network at the point where information enters adds an additional layer of protection to traditional desktop and server-based anti-virus. NTT Communications' Anti-Virus solution allows companies to scan all incoming IP traffic (Web and FTP), as well as inbound/outbound email traffic, for virus infection. Desktop virus defense alone cannot protect against viruses spreading in file sharing or peer-to-peer applications because they rely on a read/write operation to launch their scan. Our UTM Anti-Virus service blocks these memory-based threats in addition to traditional malware. Most importantly, network administrators can be relieved of the tedious task of updating virus patterns through the use of automatic updates.
